JAN 20 2000

MR. LAMONICA: My name is Rick LaMonica. I'm

25 still kind of sad. I moved to Missouri -- I grew up near
1 one of -- the only, as far as I understand, nuclear fuel
2 reprocessing plants that was ever created and it was in
3 west New York. It was finally closed down when they had
4 to admit that they had to ban milk from all the cows in
5 the surrounding counties because there was so much
6 contamination from radioactive releases. It's now being
7 used as a state nuclear dump site. I'm not sure what
8 Missouri has for a nuclear dump site. I do have a
9 background in science and I hope I don't get a few
10 scientists that work with DOE in trouble, but I'm
11 summarizing my understanding of some reports that they
12 have.

1

13 First off, I would like to say that there are
14 many reasons why this whole project is very premature and
15 should be rejected. As far as I'm aware, there is no
16 method for processing or handling nuclear waste in the 60
17 years since we started making is that have not failed.
18 Congress seems to be, in its eminent wisdom, working
19 overtime to provide more subsidies for nuclear power and
20 businesses, but the process still remains so financially
21 and technologically infeasible that no reactors have been
22 built for 25 years. I think it's absurd to really even
23 talk about moving it anywhere when you don't have any
24 idea what you're going to do when it gets there.

2

25 Congress has said we don't care, Nevada is
1 going to be an interim parking lot for this hazardous
2 waste. It seems to me unsound, until some permanent

3 method of storage can even be devised, to even think of
4 moving it some place. My main concerns are basically my
5 understanding of some reports -- articles by scientists
6 that work with DOE that there is serious concerns about
7 whether underground storage facilities can ever be safely
8 designed that could possibly isolate highly radioactive
9 waste for the necessary tens of hundreds of thousands of
10 years to allow decay of additional material. I have no
11 idea where this 10,000 years came from, but it seems to
12 be some number some bureaucrat pulled out of a hat.
13 Maybe one of our geniuses and highly ethical people in
14 Congress came up with it.

3 15 Both DOE and many other scientists find many
16 problems with this whole process. There is extensive
17 geological data, as many people have mentioned, on Yucca
18 Mountain. The area could not possibly keep the waste
19 isolated. It is highly seismologically active, it
20 contains many past volcanoes and possible magma pockets
21 now. It has highly fractured rock and will allow flow of
4 22 water and radioactive materials to occur. It is known
23 that the steel containment canisters last used to vitrify
24 in an attempt to stabilize nuclear waste fuel rods would
25 not remain intact for more than a few centuries in any
1 known storage method.

5 2 Analysis by DOE scientists show that
3 thermally nucleophilic (ph) materials -- and I'm sorry
4 that I probably am -- in case there is some scientists
5 and some PR people here -- may be misusing some of these

6 terms, but thermally nucleophilic (ph) materials such as
7 reactor rays could disperse into surrounding rocks by
8 either natural or unnatural processes. You're talking
9 about 10,000 years. We have a government that's 200
10 years. 10,000 years ago, from my understanding, would be
11 before the last ice age. The scientists that I'm mainly
12 basing this on is Bowman and Veneric or one of the labs
13 in New Mexico. Their conclusion -- and I hate to, again,
14 use a lot of technical terms, some critical
15 concentrations underground could migrate into regions of
16 critical autocatalytic self-enhancing chain reactions.
17 For us simpler people, in lay terms, that's an explosion.
18 This could occur with all types of waste from
19 all types of reactors and bomb production processes.
20 This nuclear process would be largely dependent on the
21 amount of nucleophilic (ph) material, moderation of the
22 reaction neutrons by water or rocks and surrounding
23 material. Feedback mechanisms could be either positive
24 or negative depending on the amount of water, the shape
25 and concentration of the dispersed radioactive material.

1 MR. BROWN: If you can wrap this up in about
2 a minute or so.

6 3 MR. LAMONICA: Let me -- yes. Autocatalytic
4 feedback could reach critical -- it would be increasingly
5 possible over time with the presence of water and
6 plutonium that's in this irradiated fuel rod waste. This
7 could cause underground nuclear explosions with possibly
8 a force of possibly 200 tons. The known rock fractures
9 in this mountain region would enhance both migration of

10 water and physical material, thus making the chain
11 reaction more likely and facilitate venting of plutonium
12 and other radioactive waste into air and contamination of
13 water. I want to conclude just with a statement by
14 Senator Bryan from Nevada in 1995 when they were debating
15 this thing in Congress. He said, "I am shocked and
16 outraged that the Department of Energy and the nuclear
17 power industry continues to force acceptance of a dump in
18 Nevada when it appears that their own scientists cannot
19 reach a consensus on the most fundamental safety
20 questions related to the nuclear age. The scientific
21 community is still questioning the safe premise of
22 geological storage, yet the DOE's longstanding official
23 position is that nuclear waste storage at Yucca Mountain
24 is a political problem, not a technical one."

7

25 I want to add personally I'm appalled by
1 Congress. They seem to be crafting this regardless of
2 the safety of their constituents, with the possible
3 exception just before elections. They ignore daunting
4 technical problems, repeatedly force federal agencies
5 like the Department of Energy and the liability and cost
6 on the taxpayers by mandating a national nuclear waste
7 depository. The safest method would probably be just
8 leave it where it is, and when the nuclear power plants
9 run out of storage space, then the only solution then is
10 to shut them down. There's no logic in moving 70,000
11 tons of highly radioactive waste between communities that
12 have little ability to cope with it, with extreme

8

13 likelihood of accidents over 30 years. I thank you and I
14 do hope that somebody in Washington does seriously
15 consider all the comments that people have made at all
16 these hearings.
